Overall Comments

Congratulations to all of the participants in the 2008 Euclid Contest. The average score of 46.4 is slightly lower than that of 2007. The number of participants in this year's Contest was up significantly from last year. We were very pleased that the results on the first four problems were higher than last year and there were fewer students with scores less than 20. At the same time, the later problems managed to challenge the top students even more than last year's problems. Special congratulations go to the one official contestant who achieved a perfect score of 100 out of 100 this year.

We at the Centre for Education in Mathematics and Computing believe strongly that it is very important for students to both learn to solve mathematics problems and learn to write good solutions to these problems. On this year's Euclid Contest, we included a paragraph at the beginning of the Contest encouraging students to include appropriate explanations with their mathematical work. We were reasonably happy with its effects, although there were still some students who produced paragraphs describing their algebraic manipulations and some who did not explain where it was necessary. We will continue to work on this issue and try to find ways to encourage students to include appropriate explanation in their solutions.

Special thanks go to the Euclid Problems Committee that annually sets the Contest problems and manages to achieve a very difficult balancing act of providing both accessible and challenging problems on the same paper.

To the students who wrote, the parents who supported them, and the teachers who helped them along the way, thank you for your continuing participation and support. We hope that you enjoyed the Contest and relished the challenges that it provided. We hope that mathematics contests continue to feed your love for and interest in mathematics.

Specific Comments

1. Average: 9.0

This problem overall was quite well done, with few common errors beyond arithmetic mistakes.

2. Average: 8.3

This problem was also well done, with few common errors.

3. Average: 8.1

Part (a) was done correctly by almost everyone. In part (b), a number of students did not know or use the correct formula for some of the area calculations. Also, many students did not quite answer the question that was asked and omitted part of the conclusion. We would have also preferred to see more explanation from students as to how they had calculated the areas (particularly of Figure B) rather than just presenting some equations and an answer.

4. Average: 7.1

Part (a) was fairly well done. The biggest problem experienced by students in part (b) was misreading the question, thus rounding their answer to the nearest ten rather than to the nearest tenth. A number of insightful students managed to calculate an exact answer such as $\frac{19\sqrt{6}-19\sqrt{2}}{2}$.

5. Average: 4.0

In part (a), many students found the correct answer but a large number of students did not seem to have any way to start the problem. In part (b), the most common approach was completing the square; not many students used a discriminant approach.

6. Average: 3.0

In part (a), many students calculated f(0) and then stopped, and so did not know enough terms to be able

to begin to see a pattern. Part (b) was handled quite well by those who attempted it. The written solutions were excellent. Some students assumed that the wording of the problem implied that the sequence was increasing.

7. Average: 2.4

This year, Problem 7 consisted of two written parts, rather than one short answer part and one written part. This was to help balance the higher value short answer parts in Problems 1 and 2. A number of students got the correct answer in (a), but did not sufficiently justify their work. For example, many did not acknowledge that they had checked which of the seven integers was largest and which was smallest. Part (b) was a very good thinking question. Some students solved this using a table approach, while others proceeded more analytically. There was some confusion as to whether "differ by a multiple of 4" included differing by 0 or not.

8. Average: 2.5

In part (a), it was relatively easy to determine a couple of new pieces of information, but it was not easy to find the key pieces of information. Part (b) had several different approaches and several different ways to try to combine the given information. Most approaches to part (b) required finding the length of QP before finding the length of AP.

9. Average: 1.0

Both parts of this problem took standard curriculum topics and combined them in very unusual ways. In each part, many students could see one solution without too much difficulty: x = 2 in part (a) and (x, y, z) = (1, 2, 3) in part (b). Finding the second solution in part (a) required careful use of logarithm rules and the tenacity to stick with the algebra until a quadratic equation emerged. Proving that there was a unique solution in part (b) was quite tricky and required some insightful reasoning.

10. Average: 1.0

Many students were able to calculate f(5) and f(6) in part (a), but few got past this step. There were lots of interesting patterns that could be discovered through investigation, but it was often difficult to quantify them. This problem was a great final problem for the Euclid Contest, as it combined some counting, some geometry, some algebra, and some number theory.

Please visit our website at www.cemc.uwaterloo.ca to download the 2008 Euclid Contest, plus full solutions.

Commentaires Généraux

Félicitations à tous les participants du Concours Euclide 2008. La note moyenne de 46,4 est un peu plus basse que celle de 2007. Le nombre de participants dans le Concours de cette année était significativement à la hausse comparé à l'an dernier. Nous étions très heureux que les résultats sur les premiers quatre problèmes étaient plus hauts que l'an dernier et il y avait moins d'étudiants avec des notes de 20 et moins. En même temps, les problèmes ultérieurs ont réussi à défier les meilleurs étudiants et encore plus que l'année dernière. Nos félicitations spéciales vont au concurrent officiel qui a atteint une note parfaite de 100 de 100 cette année.

Nous au Centre d'éducation en mathématiques et en informatique croyons fortement que c'est très important pour les étudiant(e)s d'apprendre à résoudre des problèmes de mathématiques et aussi d'apprendre à écrire de bonnes solutions à ces problèmes. Dans le concours Euclide de cette année, nous avons inclus un paragraphe au début du Concours encourageant les étudiants à inclure des explications appropriées à leur travail mathématique. Nous étions raisonnablement heureux avec le résultat, bien qu'il y eût encore quelques étudiants qui ont produit des paragraphes décrivant leurs manipulations algébriques et quelques-uns qui n'ont pas expliqué où c'était nécessaire. Nous continuerons à traiter ce problème et essayons de trouver différentes façons d'encourager les étudiants à inclure l'explication appropriée à leurs solutions.

Un grand merci va au Comité des problèmes du concours Euclide qui rassemble annuellement les problèmes du Concours et réussit à accomplir une tâche difficile d'établir des problèmes accessibles et stimulants sur le même papier.

Aux étudiant(e)s qui ont écrit, les parents qui les ont soutenus et les enseignant(e)s qui les ont aidés, merci pour votre participation continue et votre soutien. Nous espérons que vous avez apprécié le concours et avez savouré les défis qu'il a fournis. Nous espérons que les concours de mathématiques continuent à nourrir votre amour et intérêt pour les mathématiques.

Commentaires spécifiques

- 1. Movenne: 9,0
 - Ce problème, en tout, a été très bien fait, avec peu d'erreurs communes au-delà d'erreurs arithmétiques.
- 2. Moyenne: 8,3
 - Ce problème a été aussi bien fait, avec peu d'erreurs communes.
- 3. Moyenne: 8,1

La partie (a) a été complétée correctement par presque tout le monde. Dans la partie (b), un nombre d'étudiants n'ont pas su ou n'ont utilisé la formule correcte pour certains des calculs de l'aire. Beaucoup d'étudiants n'ont pas répondu tout à fait à la question qui était demandée et ont omis une partie de la conclusion. Nous aurions aussi préféré voir plus d'explication par les étudiants quant à comment ils avaient calculé les aires (en particulier de la figure B) au lieu de présenter juste quelques équations et une réponse.

4. Moyenne: 7,1

La partie (a) a été bien réussite. Le plus grand problème expérimenté par les étudiants dans la partie (b) était de mal lire la question, ainsi arrondissant leur réponse à la dizaine près au lieu du dixième près. Plusieurs étudiants perspicaces ont pu calculer une réponse exacte comme $\frac{19\sqrt{6}-19\sqrt{2}}{2}$.

5. Movenne: 4.0

Dans la partie (a), beaucoup d'étudiants ont trouvé la réponse correcte mais plusieurs étudiants n'ont pas trouvé la façon de commencer le problème. Dans la partie (b), l'approche la plus commune était de compléter le carré. Pas beaucoup d'étudiants ont utilisé une approche de discriminant.

6. Moyenne: 3,0

Dans la partie (a), beaucoup d'étudiants ont calculé f(0) et ont alors arrêté, et donc n'ont pas su assez de termes pour voir une constance. La partie (b) a été bien gérée par ceux qui l'ont tentée. Les solutions écrites étaient excellentes. Quelques étudiants ont supposé que la formulation du problème voulait dire que la séquence augmentait.

7. Moyenne: 2,4

Cette année, le problème 7 consistait de deux parties écrites, au lieu d'une partie à réponse courte et une partie à réponse écrite. Ceci était pour aider à balancer la plus haute valeur des parties à réponse courtes dans les problèmes 1 et 2. Un nombre d'étudiants ont obtenu la réponse correcte dans (a), mais n'ont pas justifié suffisamment leur travail. Par exemple, beaucoup n'ont pas reconnu qu'ils avaient vérifié quel nombre des sept nombres entiers était plus grand et lequel était plus petit. La partie (b) était une très bonne question de réflexion. Quelques étudiants ont résolu avec une approche de table cependant d'autres ont procédé plus analytiquement. Il y avait un peu de confusion à savoir si "la différence soit un multiple de 4" incluait différer par 0 ou pas.

8. Moyenne: 2,5

Dans la partie (a), c'était relativement facile à déterminer quelques nouveaux morceaux d'information, mais ce n'était pas facile de trouver les morceaux clés d'information. La partie (b) a eu plusieurs approches différentes et plusieurs façons différentes ont été utilisé afin de combiner l'information donnée. La plupart des approches pour la partie (b) exigeaient de trouver la longueur de QP avant de trouver la longueur de AP.

9. Moyenne: 1,0

Les deux parties de ce problème ont pris les sujets du programme standard et les ont combinés d'une façon très curieuse. Dans chaque partie, beaucoup d'étudiants pouvaient voir une solution sans trop de difficulté: x=2 dans la partie (a) et (x,y,z)=(1,2,3) dans la partie (b). Pour trouver la deuxième solution dans la partie (a), cela exigeait l'usage prudent de règles de logarithme et de la ténacité avec l'algèbre jusqu'à ce qu'une équation quadratique survienne. Prouver qui il y avait une solution unique dans la partie (b) était tout à fait difficile et exigeait du raisonnement perspicace.

10. Moyenne : 1,0

Beaucoup d'étudiants pouvaient calculer f(5) et f(6) dans la partie (a), mais peu ont pu passé cette étape. Il y avait beaucoup de modèles intéressants qui pouvaient être découverts avec de l'enquête, mais c'était souvent difficile de les quantifier. Ce problème était un grand problème final pour le Concours Euclide, comme il combinait du comptage, un peu de géométrie, un peu d'algèbre, et un peu théorie de nombre.

Veuillez visiter notre site Web à www.cemc.uwaterloo.ca pour télécharger le Concours Euclide 2008, avec solutions complètes.
